6	SFP-DD/SFP-DD112 Hardware Specification
7	
8	for
9	
10	SFP DOUBLE DENSITY PLUGGABLE TRANSCEIVER
11	
12	Revision 5.2
13 14	October 27, 2022
14	October 27, 2023
16	
17	Abstract: This specification defines: the electrical and optical connectors, electrical signals and power supplies
18	mechanical and thermal requirements of the pluggable Double Density SFP-DD module, and Double Density
19	SFP-DD112 connector and cage system. This document provides a common specification for systems
20	manufacturers, system integrators, and suppliers of modules.

The following are Promoter member companies of the SFP-DD MSA.

Alibaba Group	Hewlett Packard Enterprise	Lumentum
Broadcom	Huawei	Molex
Cisco	Intel	TE Connectivity
Coherent	Juniper Networks	
Dell Technologies	Nvidia	

2 3 4

1

The following are Contributor member companies of the SFP-DD MSA.

Accelink	Genesis Connected Solutions	Nokia
Amphenol	Hisense Broadband	Senko
AOI	Infinera	Source Photonics
Eoptolink	InnoLight	US Conec
Foxconn Interconnect Technology	Analog Devices	Yamaichi Electronics
Fourte International	MultiLane	ZTE

5 6 7

Change History:

Revision	Date	Changes
1.0	September 14 2017	Initial public release.
2.0	September 17, 2018	Added Type 2 module. Changed IntL pin to reserved, Changed TxFault to TxFault/Int Updated drawings to include new key. Added test conditions for insertion removal forces.
3.0	April 10 2019	Added 5 W power class. Added SN, MDC connectors. Deleted requirement that host shall not change the state of LPMode when module is present.
4.0	Withdrawn	
4.1	August 10, 2020	Added ResetL, IntL, ePPS, Fault signals. Added timing tables for low speeds signals, soft control and status. Chapter 7-Management Interface is now part of Chapter 4-Electrical Specification. Port mapping, optical connectors, and module color coding moved out of Mechanical and Board Definition Chapter-5 and into a new Chapter-5. Appendix A- Normative Connector Performance Requirements added.
4.2	August 17, 2020	Added dual functionality IntL/TXFaultDD signal definition for SFP-DD.
5.0	October 1, 2021	Added chapter 5 Electrical Specifications for SFP112, added chapter 8 Mechanical specification of SFP-DD112, added chapter 9 Mechanical Specification of SFP112. Added ePPS/Clock signals definition for SFP- DD/SFP-DD112.
5.1	March 11, 2022	Defined a new improved power supply test method 4.10, squelch level reduced to 50 mV for 112G operation 4.8.2. TWI bus timing removed from chapter 4 as identical timing diagram already included in CMIS.
5.2	October 27, 2023	SFP-DD112 improved module paddle card 7.3 added option for double or triple split in the pre-wipe signal pads. SFP112 chapters are removed as they are now documented as SFP2 in the SFF-TA-1031 [28].

8 9

Foreword

10 The development work on this specification was done by the SFP-DD MSA, an industry group. The

11 membership of the committee since its formation in May 2017 has included a mix of companies which are 12 leaders across the industry.

13

The members of the SFP-DD MSA would like to acknowledge the contributions of Edmund Poh. He was an
 excellent engineer; his technical skills and collaborative attitude will be missed.

1 **1. Scope**

The scope of this specification is the definition of a high density 1-channel and 2-channels modules, cage and connector system. SFP-DD supports up to 100 Gb/s in aggregate over a 2 x 50Gb/s electrical interface. SFP-DD112 supports up to 200 Gb/s in aggregate over a 2 x 100 Gb/s electrical interface. The cage and connector design provides backwards compatibility to SFP+ [25], [26], and SFP2 [28] modules which can be inserted into an SFP-DD/SFP-DD112 cage and connector using the electrical channels 1. Furthermore, SFP+ modules maybe inserted into SFP-DD/SFP-DD112 hosts and cage system. Furthermore, SFP2 modules maybe inserted into SFP-DD/SFP-DD112 hosts and cage system that implements SFP2 dual schematic.

10 **1.1 Overview of SFP-DD/SFP-DD112 Specifications**

SFP-DD/SFP-DD112 specifications are organized into 10 chapters and one appendix addressing electrical, mechanical,
 environmental, and management aspects of the module.

- Chapter 1 Scope
- Chapter 2 References and Related Standards and SFF Specifications
- Chapter 3 Introduction
- Chapter 4 Electrical specifications and management interface timing for SFP-DD/SFP-DD112
- Chapter 5 Optical port mapping and optical interfaces
- Chapter 6 SFP-DD Mechanical specifications, printed circuit board recommendations
- Chapter 7 SFP-DD112 Mechanical specifications, printed circuit board recommendations
- Chapter 8 Environmental and thermal consideration
- Appendix A Normative module and connector performance requirements.

3. Introduction

This Specification covers the following items:

- Electrical interfaces including pad assignments for data, control, status and power supplies and host PCB layout requirements.
- Optical interfaces (including optical receptacles and mating fiber plugs for multimode and single-mode duplex and parallel fiber applications). Breakout cable applications are also specified.
- Mechanical specifications including dimensions and tolerances for the connector, cage and module system. Includes details of the requirements for correct mating of the module and host sides of the connector.
- Thermal requirements
- Management Interface Timing requirements
- Electrostatic discharge (ESD) requirements by reference to industry standard limits and test methods.

This Specification does not cover the following items:

- Electromagnetic interference (EMI) protection. EMI protection is the responsibility of the implementers of the cages and modules.
- Optical signaling specifications are not included in this document but are defined in the applicable industry standards.
- Management Registers.

1 3.1 Objectives

SFP-DD/SFP-DD112 electrical signals, channel assignments, TWI, timing, and power requirements are defined in Chapter 4. Optical port mapping and optical interfaces are defined in Chapter 5 to ensure that the pluggable modules and cable assemblies are functionally interchangeable. Implementations compliant to dimensions, mounting and insertion requirements defined in Chapter 6 for SFP-DD bezel, optical module, cable plug, cage and connector system on a circuit board ensure that these products are mechanically interchangeable. Chapter 7 describes an improved SFP-DD form factor called SFP-DD112 with improved signal integrity for 100 Gb/s per lane (56 GBd) operation with an aggregate bandwidth of 200 Gb/s.

40 **3.2 SFP-DD/SFP-DD112 System Overview**

The SFP-DD form factor system consisting of a transceiver module, cage and connector provides two channels for high speed signals that can support a two-lane trunked application or two independent single-lane applications. The cage and socket can also accept SFP+ [25], [26] and SFP2 [28] modules in which case a single lane channel is supported. To support classic SFP+/SFP2 modules the electrical connector maintains the twenty contacts row defined for SFP+ modules and adds another twenty contacts row to support a second channel.

47

In addition to contacts for the high speed data signals, the connector provides contacts for module and
 channel control and status signals including a pair that form a Two-Wire Interface (TWI) [17] or communication

- 50 with the module's memory. Contacts for high speed data signals, channel level control and status indicator
- 51 signals and power supply sources for the SFP+ module are repeated in the row for the second channel.
- 52 Contacts for module hardware control and status signals in the SFP+ module remain in place and signals for

- new module level functions were added to the second row, but SFP2 adds Interrupt signal pad and makes
 module hardware control and status optional.
 3
- New global features and associated signals, Low Power Mode, Reset and Interrupt were added and the
 memory map for SFP-DD was expanded and reorganized for better alignment with CMIS functionality and
 structure.
- 8 SFP-DD management specifications is based on SFP-DD MIS [19]. SFP-DD112 management specifications
 9 are based on CMIS [5].
- Within the MIS and CMIS the SFP+ and SFP-DD/SFP-DD112 classic contacts, see Figure 3, are associated as Channel 1 and the SFP-DD/SFP-DD112 additional contacts are associated as Channel 2. Within this document the name, Channel 1, is synonymous with the name SFP+ "classic" Channel and Channel 2 is synonymous with the name DD "additional" Channel.
- Adding a second channel to SFP-DD/SFP-DD112 results in increased module power consumption.
 Accommodations for the increased consumption include defining additional power classes, defining a Type 2
 module and defining an enlarged heat sink seating area with surface flatness and roughness requirements. A
 low power mode was added to provide the host a means for power management.
- Another accommodation for a second channel was the inclusion of addition optical connectors including MPO [9] and [21], duplex LC [10] and [22], see Figure 16.
- 23 24 25

3.3 Applications

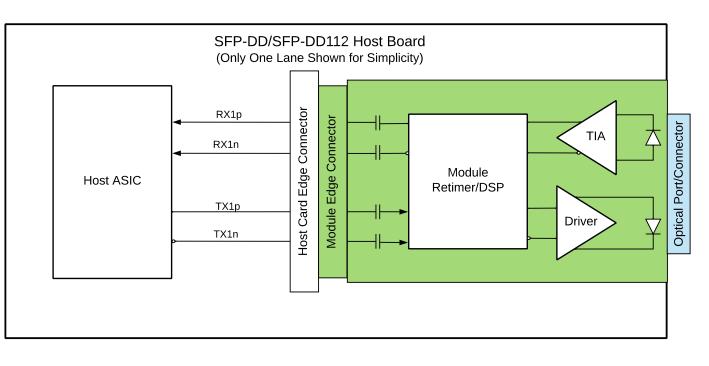

1 2 3

4

This specification defines a connector, cage and module for single or double lane applications at up to 112 Gb/s (56 GBd) per lane. Intended applications include but are not limited to Ethernet and/or InfiniBand and/or Fibre Channel. The SFP-DD/SFP-DD112 interface can support pluggable modules or direct attach cables based on multimode fiber, single mode fiber or copper wires.

9

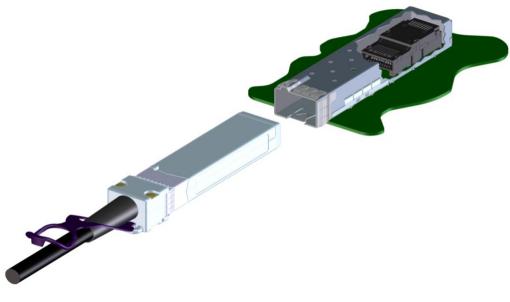

An application reference Model, shown in Figure 1, shows the high-speed data interface between an ASIC and the SFP-DD/SFP-DD112 modules.

10 11

Figure 2: SFP-DD/SFP-DD112 Cage, Connector and Module

4. Electrical Specification and Management Interface Timing for SFP-DD/SFP-DD112

3 This chapter contains signal definitions and requirements that are specific to the SFP-DD/SFP-DD112 4 modules. High-speed signal requirements including compliance points for electrical measurements are defined 5 in the applicable industry standard.

6

7 4.1 **General Requirements**

8 The SFP-DD/SFP-DD112 modules are hot-pluggable. Hot pluggable refers to plugging in or unplugging a 9 module while the host board is powered.

10

11 For EMI protection the signals from the host connector should be shut off when the SFP-DD/SFP-DD112 modules are not present. Standard board layout practices such as connections to Vcc and GND with vias, use 12 of short and equal-length differential signal lines are recommended. The SFP-DD/SFP-DD112 modules signal 13 14 ground contacts GND should be isolated from module case. An isolated SFP-DD/SFP-DD112 module case 15 from signal ground provides equipment designer flexibility regarding connections between external electromagnetic interference shields and circuit ground "GND" of the module. 16

17

18 All electrical specifications shall be met over the entire specified range of power supplies given in section 4.10.

19

29

30

31

20 4.2 Electrical Connector

21 The SFP-DD/SFP-DD112 module edge connector consists of a single paddle card with 20 pads on the top and 22 20 pads on the bottom of the paddle card for a total of 40 pads. The pads positions are defined to allow 23 insertion of either an SFP-DD/SFP-DD112 module or an SFP+ into the SFP-DD/SFP-DD112 receptacle. The 24 classic signal locations are deeper on the paddlecard, so that classic SFP+ module pads only connect to the 25 longer row of connector pins, leaving the short row of connector pins open circuited in an SFP+ application. 26

27 The pads are designed for a sequenced mating: 28

- First mate ground pads •
- Second mate power pads
- Third mate signal pads.

32 Because the SFP-DD/SFP-DD112 module has 2 rows of pads, the additional SFP-DD pads will have an 33 intermittent connection with the classic SFP+/SFP2 pads in the connector during the module insertion and removal. The 'classic' SFP+/SFP2 pads have a "B" label shown in Table 1 to designate them as the first row of 34 35 module pads to contact the SFP-DD/SFP-DD112 connectors. The additional SFP-DD/SFP-DD112 pads have a "A" label with first, second and third mate to the connector pins for both insertion and removal. Each of the 36 37 first, second and third mate connections of the classic SFP+ pads and the respective additional SFP-DD/SFP-38 DD112 pads are simultaneous.

Figure 3 shows the signal symbols and pad numbering for the SFP-DD/SFP-DD112 modules edge connector 40 41 overlaid with classic SFP+ pads. Figure 4 shows the signal symbols and pad numbering for the SFP-DD/SFP-DD112 modules edge connector overlaid with SFP2 compatibility mode, the grayed-out pads of SFP+/SFP-42 43 DD/SFP-DD112 are not used by SFP2 module [24]. The diagram shows the module PCB edge as a top and bottom view. There are 40 pads intended for high speed signals, low speed signals, power and ground 44 45 connections.

46

39

Editor's note: Figure 4 the SFP-DD/SFP-DD112 pad definition in SFP2 compatibility mode may require some 47 48 updates to be fully aligned after publication of SNIA SFP2 specifications [24].

49

Table 1 provides more information about each of the 40 pads of the SFP-DD/SFP-DD112 connector. Figure 50 51 28 and Figure 29 show pad dimensions for SFP-DD module, and the surface mount connector configuration is shown in Figure 35. Figure 38 and Figure 39 show improved pad dimensions for SFP-DD112 module, and the
 improved surface mount connector configuration is shown in Figure 42.

3

For EMI protection the signals from the host connector should be shut off when the SFP-DD/SFP-DD112 module is not present. Standard board layout practices such as connections to Vcc and GND with vias, use of short and equal-length differential signal lines are recommended. The chassis ground (case common) of the SFP-DD/SFP-DD112 module should be isolated from the module's circuit ground, GND, to provide the equipment designer flexibility regarding connections between external electromagnetic interference shields and circuit ground, GND, of the module.

10

11 Because the SFP-DD/SFP-DD112 module has 2 rows of pads, the additional SFP-DD/SFP-DD112 pads will 12 have an intermittent connection with the classic SFP+/SFP2 pads in the connector during the module insertion 13 and removal. SFP-DD/SFP-DD112 module pads are compatible with SFP+ [24] [25] and SFP2 [24] and are 14 designated as "classic" pads in Table 1 to designate them as the second row of module pads to contact the 15 SFP-DD/SFP-DD112 connector. The additional module pads are designated as "DD" pads in Table 1 to designate them as the first row of module pads to contact the SFP-DD/SFP-DD112 connector. The additional 16 SFP-DD/SFP-DD112 pads have first, second and third mate to the connector pins for both insertion and 17 18 removal. Each of the first, second and third mate connections of the classic SFP+/SFP2 pads and the 19 respective additional SFP-DD/SFP-DD112 pads are simultaneous. For a reliable interconnect, a sufficient 20 contact wipe of the connector pins sliding over the module gold pads is required. In the past, long signal pads have been used to provide the mechanical wipe. As operating speeds were relatively slow, the electrical stub 21 22 was not an issue with signal integrity. 23

As operating speeds have increased, signal pad lengths have become shorter and shorter to reduce electrical stubs, however this caused insufficient mechanical wipe. A solution is to add a small separation of the signal pad such that there is a passive 'pre-wipe" pad and an active signal pad, see Figure 29 and Figure 39. In SFP-DD/SFP-DD112, there are also long pre-wipe pads between the additional SFP-DD/SFP-DD112 pads and the classic SFP+/SFP2 pads. This provides connector pins a gold platted pad surface over which to slide between rows.

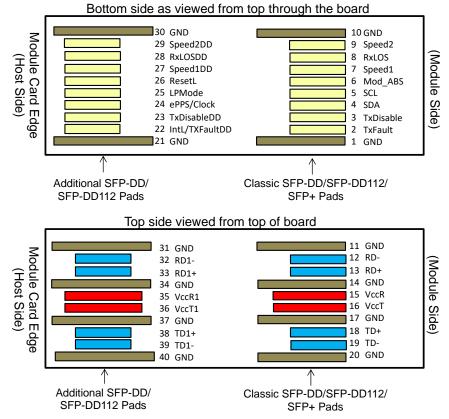

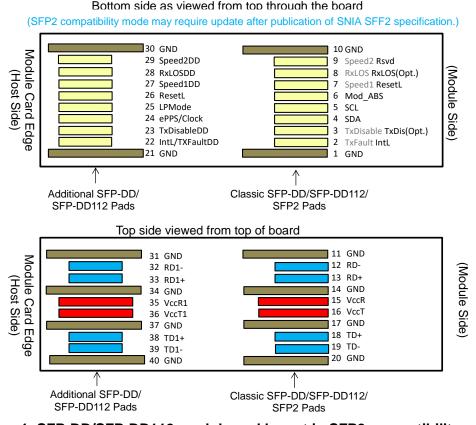

Figure 3: SFP-DD/SFP-DD112 module pad layout overlaid with SFP+ pads

Pad	Logic	Symbol	Table 1- Pad Function Definition Module Pad Descriptions	Plug Sequence⁴	Notes
0		Case	Module case	0	
1		GND	Ground	1B	1

39	CML-I	TD1-	Inverse Transmit Data In for DD channel	3A	
40		GND	Ground	1A	1

Notes:

1. SFP-DD uses common ground (GND) for all signals and supply (power). All are common within the SFP-DD module and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal-common ground plane.

 VccR, VccT shall be applied concurrently and VccR1, VccT1 shall be applied concurrently. Requirements defined for the host side of the Host Card Edge Connector are listed in Table 12. VccR, VccT, VccR1, VccT1 may be internally connected within the module in any combination. The connector Vcc pins are each rated for a maximum current of 1000 mA.

3. The ePPS pins (if not used) may be terminated with 50 Ω to ground on the host.

 Plug Sequence specifies the mating sequence of the host connector and module. The sequence is 0, 1A, 2A, 3A, 1B, 2B, 3B. (see Figure 3 for pad locations) Contact sequence A will make, then break contact with additional SFP-DD/SFP-DD112 pads. Sequence 1A, 1B will then occur simultaneously, followed by 2A, 2B, followed by 3A,3B.

1 4.3 Overview of the Low Speed Electrical Hardware Signals

2 The SFP-DD/SFP-DD112 connector allocates contacts for a set of low speed signals for control, status and 3 management by the host. These include dedicated hardware signals and TWI signals. The dedicated 4 hardware signals are the following:

- TxDisable, TxDisableDD •
 - **RxLOS, RxLOSDD** •
 - Speed1, Speed2, Speed1DD, Speed2DD •
 - TxFault •
 - IntL/TXFaultDD •
- Mod ABS •
- LPMode •
- ResetL •
- ePPS/Clock.

15 The TWI signals are the following: 16

- SCL clock
- SDA data.

4.3.1 TxDisable, TxDisableDD 19

20 TxDisable and TxDisableDD are module input signals. When TxDisable or TxDisableDD are asserted high or 21 left open, the appropriate SFP-DD/SFP-DD112 module transmitter output shall be turned off unless the 22 module is a passive cable assembly in which case this signal may be ignored. This signal shall be pulled up to VccT in modules and cable assemblies. When TxDisable or TxDisableDD are asserted low or grounded the 23 24 module transmitter is operating normally.

26 4.3.2 RxLOS, RxLOSDD

27 RxLOS (Rx Loss of Signal) and RxLOSDD are open drain/collector outputs that require a resistive pull up to Vcc Host with a resistor in the range 4.7 k Ω to 10 k Ω , or with an active termination according to Table 5. 28 29 When high it indicates an optical signal level below that specified in the relevant standard.

30

25

5 6 7

8

9

10

11

12

13

14

17 18

LOS may be an optional function depending on the supported standard. If the LOS function is not 31 32 implemented, or is reported via the TWI only, the RxLOS contact shall be held low by the module and may be 33 connected to GND within the module.

34

35 RxLOS, RxLOSDD assert min and de-assert max are defined in the relevant standard. To avoid spurious transition of LOS a minimum hysteresis of 0.5 dBo is recommended. 36

37

4.3.3 Speed1, Speed2, Speed1DD, Speed2DD 38

Speed1, Speed2, Speed1DD and Speed2DD are module inputs and are pulled low to GND with >30 k Ω 39 resistors in the module. Speed1 optionally selects the optical receive signaling rate for channel 1. Speed1DD 40 optionally selects the optical receive signaling rate for channel 2. Speed2 optionally selects the optical transmit 41 42 signaling rate for the channel 1. Speed2DD optionally selects the optical transmit signaling rate for channel 2. For logical definitions of hardware rate selects Speed1, Speed2, Speed1DD, Speed2DD, see 4.9. 43 44

- 45 Note: At 128 GFC the FC LSN no longer require to use Speed1, Speed2, Speed1DD and Speed2DD, it is under consideration to reclaim these signals for programmable or other functions. 46
- 47

4.3.4 TxFault 48

- TxFault is a module wide (channel 1 and channel 2) output signal that when high, indicates that the module 49
- 50 has detected a fault condition and has entered the Fault state. TxFault signal can optionally be configured as
- classic SFP+ Module (channel 1) Fault Indication via TWI as described in the SFP-DD MIS. If TxFault is not 51

- 1 implemented, the contact signal shall be held low by the module and may be connected to GND within the
- 2 module. The TxFault output is open drain/collector and shall be pulled up to the Vcc_Host on the host board
- 3 with a resistor in the range 4.7 k Ω to 10 k Ω , or with an active termination according to Table 5.
- 4

5 4.3.5 IntL/TxFaultDD

- 6 IntL/TxFaultDD is an open collector output that optionally can be configured for either the IntL signal or the
- 7 TxFaultDD signal. It shall be pulled to Vcc Host on the host board with a resistor in the range 4.7 k Ω to 10 k Ω , 8 or with an active termination according to Table 5. At power-up or after ResetL is released to high,
- 9 IntL/TxFaultDD is configured as IntL. If supported IntL/TxFaultDD can be optionally programmed as
- 10 TxFaultDD using TWI as defined in the SFP-DD Management Interface Specification.
- 11

When IntL/TxFaultDD is configured as IntL, a Low indicates a change in module state, a possible operational fault or a status critical to the host system. The host identifies the source of the interrupt using TWI. The IntL signal is de-asserted High after all set flags are read.

15

When IntL/TxFaultDD is configured as TxFaultDD, a High indicates that the module has detected a fault
condition in lane 1 and has entered the Fault state. (See SFP-DD MIS section 6.3.1.11) and if TxFaultDD is
not implemented, the contact signal shall be held low by the module.

19

20 4.3.6 Mod_ABS

Mod_ABS must be pulled up to Vcc Host on the host board and pulled low in the module. The Mod_ABS is asserted "Low" when the module is inserted. The Mod_ABS is deasserted "High" when the module is physically absent from the host connector due to the pull up resistor on the host board.

24

25 **4.3.7 LPMode**

LPMode is an input signal from the host operating with active high logic. The LPMode signal must be pulled up to Vcc in the SFP-DD/SFP-DD112 module. The LPMode signal allows the host to define whether the SFP-DD/SFP-DD112 module will remain in Low Power Mode until software enables the transition to High Power Mode as defined in the SFP-DD management specification. In Low Power Mode (LPMode de-asserted Low), the module may immediately transition to High Power Mode after the management interface is initialized.

31

32 4.3.8 ResetL

The ResetL signal shall be pulled to Vcc in the module. A low level on the ResetL signal for longer than the minimum pulse length (t_Reset_init) (See Table 7) initiates a complete module reset, returning all user module settings to their default state.

36

37 4.3.9 ePPS/Clock PTP Reference Clock (Optional)

38 Host ePPS/Clock The ePPS/Clock input is a programable timing and clock input, that can support

- 39 unmodulated 1PPS (1 pulse per second), modulated (1PPS), and reference clock. The ePPS/clock is a
- 40 LVCMOS compatible signal with series termination (TBD) on the host board and a parallel termination of at
- 41 least 4.7 k Ω in the module. To improve signal integrity for faster clocks (i.e., 156.25 MHz) the parallel
- 42 termination can be reduced to as low as 470 Ω and optionally AC coupled.
- 43
- 44 For high-performance Precision Time Protocol (PTP) applications [13], the ePPS (Enhanced Pulse Per
- 45 Second) reference either with 1PPS modulated or unmodulated may be provided from the host to the module
- 46 for time synchronization, see Table 2 for advertise capability. This can be used for either offline delay
- 47 characterization or real-time delay compensation within the module. The ePPS is used to synchronize tightly
- the Host Time-of-Day counter to the module internal Time-of-Day Counter.

The ePPS/Clock module input optionally can be configured to provide reference clock to the CDR/DSP, see Table 2 for advertise capability.

3 4 5

1 2

Table 2- ePPS/Clock Advertising Capabilities				
CMIS Byte	Bit	Mode Supported		
Location (TBD)				
xxxxxx	00	ePPS/Clock not supported

xxxx	0011	24.576 MHz
xxxx	0100	25 MHz
XXXX	0101	156.25 MHz
xxxx	0110-1101	Reserved
XXXX	1110-1111	Custom

10

11 Editor's Note: registers to support optional ePPS/Clock will be added in future revisions of CMIS.

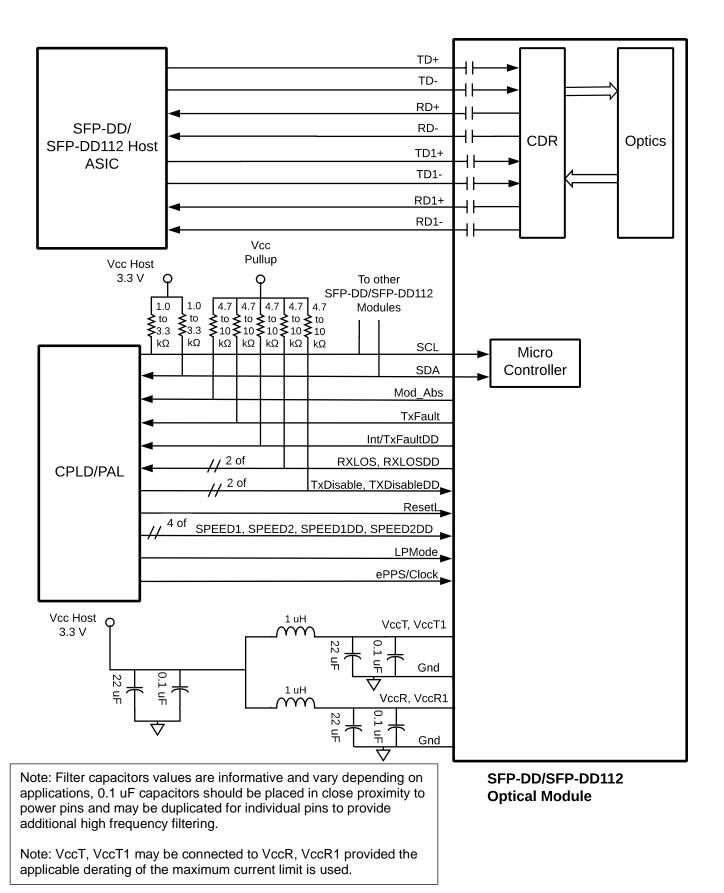

12 13

14 **4.3.10 TWI Signals SCL, SDA**

SCL is the TWI clock and SDA is the TWI data line. SCL and SDA are pulled up to Vcc_Host by resistors on
 the host board. For TWI electrical specifications see 4.5.1 and for TWI protocol and timing specifications see
 Figure 9.

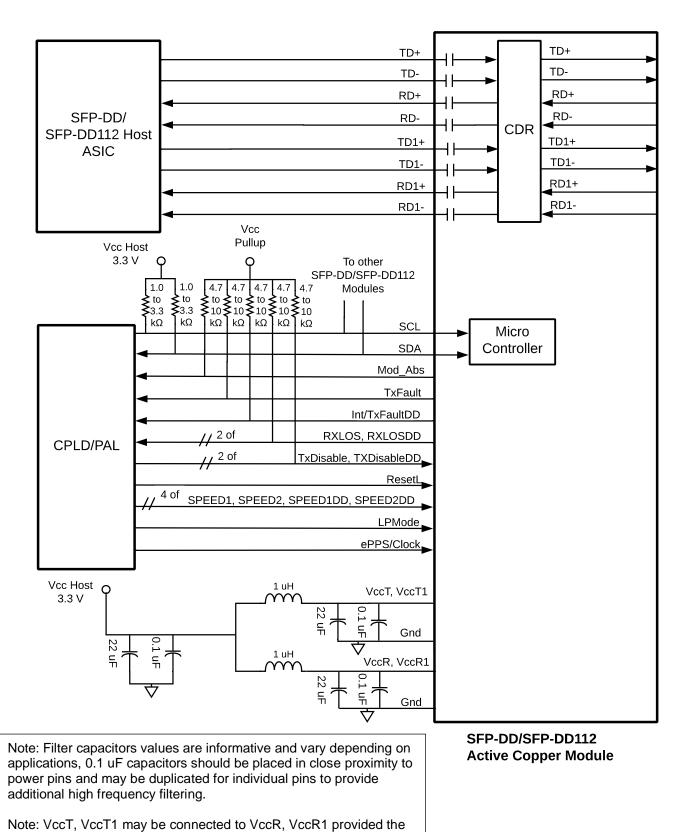

18 **4.4 Example SFP-DD/SFP-DD112 Host Board Schematics**

- 19 Figure 5, Figure 6 and Figure 7 show examples of SFP-DD/SFP-DD112 host PCB schematics with
- connections to CDR and control ICs. Note alternate electrical/optical interfaces are supported using optical
 multiplexing (WDM) or electrical multiplexing.

1 2 3

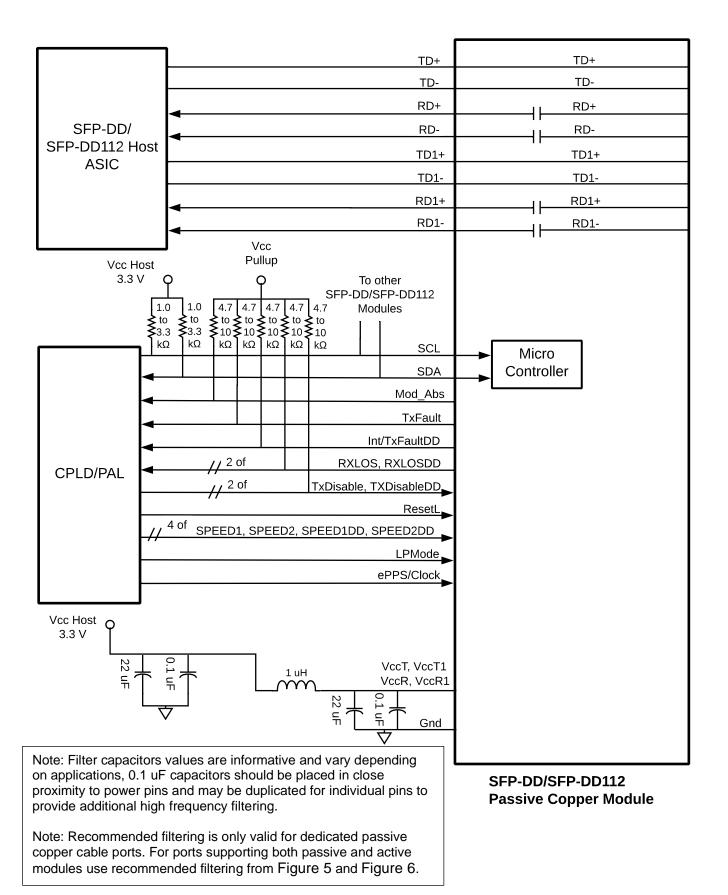

Figure 7: Example SFP-DD/SFP-DD112 Host Board Schematic for passive copper cables

1 4.5 Low Speed Electrical Specification

2 Low Electrical requirements for low speed signals TxDisable, TxDisableDD, RxLOS, RxLOSDD, Speed1, 3 Speed2, Speed1DD, Speed2DD, TxFault, IntL/TXFaultDD, Mod ABS, LPMode, ResetL and ePPS are based 4 on Low Voltage TTL (LVTTL) [15] operating at a module supply voltage Vcc of 3.3V +/- 5% and with a host 5 supply voltage Vcc Host range of 2.38 to 3.46V. Vcc is used as a generic term for the supply voltages of 6 VccTx, VccRx, VccPullup or Vcc1. Host biasing requirements (e.g. pullup resistors) are defined in 4.3 and 7 illustrated in 4.4. 8

9 Electrical requirements for the TWI signals, SCL and SDA are based on Low Voltage CMOS (LVCMOS) [15] 10 operating at Vcc and compatible with [17]. Host biasing requirements (e.g. pullup resistors) are defined in 4.3 and illustrated in 4.4. Capacitance loading requirements are defined in Table 5 and tradeoffs are illustrated in 11 Figure 8. 12

13

14 TWI Logic Levels and Bus Loading 4.5.1

The SFP-DD/SFP-DD112 low speed electrical specifications are given in Table 5. Implementations compliant 15 to this specification ensures compatibility between host bus initiator and TWI. Tradeoffs among Pull up 16 resistor values, bus capacitance and rise time are shown in Figure 8. 17

- 18

4 4.6 Management Interface and Timing

A management memory interface (See SFP-DD MIS [19], CMIS[5]), as already commonly used in other form
 factors like QSFP-DD, QSFP, and SFP+ enables module functionality and flexibility beyond that supported by
 the dedicated hardware signals. Read/Write functionality and protocols are defined in SFP-8419 [24].

Some timing requirements are critical, especially for a multi-channel device, so the interface speed may optionally be increased. Byte 00 on the Lower Page or Address 128 Page 00 is used to advertise the use of the CMIS [5] for SFP-DD112 or MIS [19]. When a classic SFP+/SFP2 module is inserted into an SFP-DD/SFP-DD112 port the host must use the SFP+ memory map, i.e., SFF-8472 [27]. This case is outside the scope of this document.

In some applications, muxing or demuxing may occur in the module. In this specification, all references to
channel numbers are based on the electrical connector interface channels, unless otherwise indicated. In
cases where a status or control aspect is applicable only to channels after muxing or demuxing has occurred,
the status or control is intended to apply to all channels in the mux group, unless otherwise indicated.

20 Timing requirements for the TWI signals, SCL and SDA are compatible with NXP I2C-bus specifications [17].

Editor Note: It is anticipated that SFP-DD112 management is targeted to use future revisions of CMIS that supports FC.

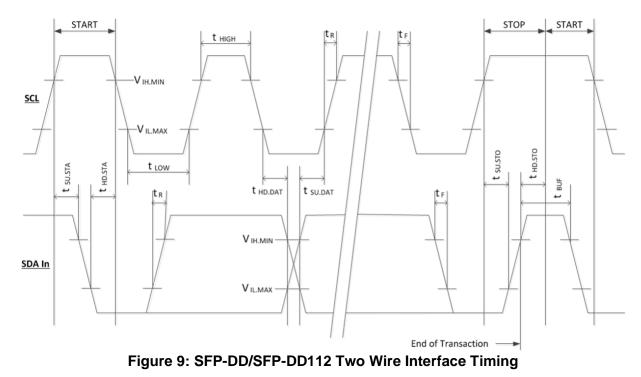

19

21

6

2 4.6.1 Management Timing Specification

The SFP-DD/SFP-DD112 TWI and memory management timing illustrated in in Figure 9 and the parameters given in Table 6. Implementations compliant to these specifications ensure compatibility between host bus initiator and the TWI.

,	1	
	I	

Table 6- Management Interface timing parameters

Parameters	Symbol	Min	Max	Min	Max	Unit	Conditions
		Fast Mode		Fast Mode			
		(400	KHz)	Plus (1	Plus (1 MHz)		
Clock Frequency	fSCL	0	400	0	1000	KHz	
Clock Pulse Width Low	tLOW	1.3		0.50		μs	
Clock Pulse Width High	tHIGH	0.6		0.26		μs	
Time bus free before new transmission can start	tBUF	20		20		μs	Between STOP and START and between ACK and ReStart
START Hold Time	tHD.STA	0.6		0.26		μs	The delay required between SDA becoming low and SCL starting to go low in a START
START Setup Time	tSU.STA	0.6		0.26		μs	The delay required between SCL becoming high and SDA starting to go low in a START
Data In Hold Time	tHD.DAT	0		0		μs	
Data In Setup Time	tSU.DAT	0.1		0.1		μs	
Input Rise Time	tR		300		120	ns	From (VIL, MAX=0.3*Vcc) to (VIH, MIN=0.7*Vcc)
Input Fall Time	t⊨		300		120	ns	From (VIH, MIN=0.7*Vcc) to (VIL, MAX=0.3*Vcc)
STOP Setup Time	tSU.STO	0.6		0.26		μs	
STOP Hold Time	tHD.STO	0.6		0.26		μs	
Serial Interface Clock Holdoff "Clock Stretching"	T_clock_hold		500		500	μS	Maximum time the SFP-DD module may hold the SCL line low before continuing with a read or write operation
Complete Single or Sequential Write	tWR		80		80	ms	Complete (up to) 8 Byte Write
Accept a single or sequential write to volatile memory	tNACK		10		10	ms	Time to complete a Single or Sequential Write to volatile registers.
Time to complete a memory bank/page	tBPC		10		10	ms	Time to complete a memory bank and/or page change.
Endurance (Write Cycles)		50K		50k		cycles	Module Case Temperature = 70 °C

Timing for soft control and status functions 1 4.7

2 Timing for SFP-DD/SFP-DD112 soft control and status functions are described in Table 7. Squelch and disable timings are defined in Table 8.

3 4

Table 7- Timing for SFP-DD/SFP-DD112 soft control and status functions

Parameters	Symbol	Min	Max	Unit	Conditions
	Max MgmtInit		2000	ms	Time from power on ¹ to hot plug or rising edge
MgmtInitDuration	Duration				of reset until completion of the MgmtInit State
ResetL Assert Time	t reset init	10		μs	Minimum pulse time on the ResetL signal to

Table 8- I/O Timing for Squelch & Disable

Notes:

1. Measured from LOW to HIGH SDA signal transition of the STOP condition of the write transaction.

2. CMIS 4.0 and beyond the listed values are superseded by the advertised DataPathTxTurnOff_MaxDuration and DataPathTxTurnOn_MaxDuration times in CMIS or SFP-DD MIS P01h.168.

3. Listed values place a limit on the DataPathTxTurnOff_MaxDuration and DataPathTxTurnOn_MaxDuration times (CMIS or SFP-DD MIS P01h.168) that can be advertised by such modules (for CMIS 4.0 and beyond).

1

2 **4.8 High Speed Electrical Specifications**

For detailed electrical specifications see the appropriate specification, e.g. IEEE Std 802.3-2022 [11], 802.3ck
[12]; FC-PI-6 [1], FC-PI-7[2], FC-PI-8 [3]; OIF-CEI-5.1 [18], or the InfiniBand specifications [14].

Partial or complete squelch specifications may be provided in the appropriate specification. Where squelch is
not fully defined by the appropriate specification, the recommendations given in clause 4.8.1 and 4.8.2 may be
used.

9

10 4.8.1 RD0+, RD0-, RD1+, RD1-

11 RD(n)+/- are SFP-DD/SFP-DD112 module receiver data outputs. Rx(n)+/- are AC-coupled 100 Ohm

12 differential lines that should be terminated with 100 Ohm differentially at the Host ASIC(SerDes). The AC

- 13 coupling is inside the SFP-DD/SFP-DD112 module and not required on the Host board. When properly
- 14 terminated, the differential voltage swing shall be less than or equal to 900 mVpp or the relevant standard, whichever is less
- 15 whichever is less.

16 Output squelch for loss of optical input signal, hereafter RX Squelch, is required and shall function as follows.

- 17 In the event of the Rx input signal on any optical port becoming equal to or less than the level required to
- 18 assert LOS, then the receiver output(s) associated with that Rx port shall be squelched. A single Rx optical

port can be associated with more than one Rx output as shown in Table 14. In the squelched state output
 impedance levels are maintained while the differential voltage amplitude shall be less than 50 mVpp.

3

In normal operation the default case has RX Squelch active. Rx Squelch can be deactivated using Rx
Squelch Disable through the 2-wire serial interface.

6

7 4.8.2 TD0+, TD0-, TD1+, TD1-

8 TD(n)+/- are SFP-DD/SFP-DD112 module transmitter data inputs. They are AC-coupled 100 Ohm differential
9 lines with 100 Ohm differential terminations inside the SFP-DD/SFP-DD112 optical module. The AC coupling
10 is implemented inside the SFP-DD/SFP-DD112 optical module and not required on the Host board.

11 12 Output squelch for loss of electrical signal, hereafter Tx Squelch, is an optional function. Where implemented 13 it shall function as follows. In the event of the differential, peak-to-peak electrical signal amplitude on any 14 electrical input lane becoming less than the TX Squelch Levels specified in Table 9 when terminated in to 100 15 Ω differential, then the transmitter optical output associated with that electrical input lane shall be squelched 16 and the associated TxLOS flag set. If multiple electrical input lanes are associated with the same optical output 17 lane, the loss of any of the incoming electrical input lanes causes the optical output lane to be squelched.

18 19

Data Rate	Levels	Unit
OIF 28G-VSR/IEEE 802.3 CL83E	70	mV ¹
OIF 56G-VSR/IEEE 802.3 CL120E	70	mV ¹
OIF 112G-VSR/IEEE 802.3 CL120G	50	mV ¹
1. Differential peak-peak.	·	

Table 9- TX Squelch Levels

20

For applications, e.g., Ethernet, where the transmitter off condition is defined in terms of average power, squelching by disabling the transmitter is recommended and for applications, e.g. InfiniBand, where the transmitter off condition is defined in terms of OMA, squelching the transmitter by setting the OMA to a low level is recommended.

In module operation, where TX Squelch is implemented, the default case has TX Squelch active. TX Squelch
 can be deactivated using TX Squelch Disable through the 2-wire serial interface. TX Squelch is an optional
 function. If TX squelch is implemented, the disable squelch must be provided.

29

30 **4.9 Rate Select Hardware Control**

The module provides 4 inputs Speed1, Speed2, Speed1DD and Speed2DD that can optionally be used for rate selection as defined in Table 10. Speed1, Speed1DD specifies the highest rate advertised by the channels. Speed2, Speed2DD specifies a lower speed for each channel. Speed1 controls the receive path signaling rate capability for the channel 1 receive path. Speed1DD controls the receive path signaling rate capability for the channel 2 receive path. Similarly, Speed2 controls the transmit path signaling rate capability for channel 1 and Speed2DD controls the transmit path signaling rate capability path.

38

The rate select functionality can also be controlled by software as defined by the SFP-DD or SFP-DD112
 management specification.

41

For 64 GFC FC-PI-8 [3] operation link speed is determined with FC Link Speed Negotiation (LSN) exchange
 while the link is operating at 32 GFC.

Table 10- Rate Select Hardware Control						
Parameters State Conditions						
Speed1, Speed1DD	Low	RX signaling rate of 14.025 GBd (16 GFC) ¹				
	High	RX signaling rate of 28.05 GBd (32 GFC)				
Speed2, Speed2DD	Low	TX signaling rate of 14.025 GBd (16 GFC) ¹				
High TX signaling rate of 28.05 GBd (32 GFC)						
Note 1: For SFP-DD112 o	Note 1: For SFP-DD112 operating at 128 GFC there is no requirement for 16 GFC or rate select.					

3

8

4 **4.10** Power Requirements

SFP-DD/SFP-DD112 has four designated power supply pins VccT, VccT1 VccR, VccR1 in the connector.
Power is applied concurrently to VccT, VccR in the row for channel 1 and concurrently to VccT1, VccR1 in the
row for channel 2.

A host board together with the SFP-DD/SFP-DD112 module(s) forms an integrated power system. The host
 supplies stable power to the module. The module limits electrical noise coupled back into the host system and
 limits inrush charge/current during hot plug insertion.

All power supply requirements in Table 12 shall be met at the maximum power supply current. No power
 sequencing of the power supply is required of the host system since the module sequences the contacts in the
 order of ground, supply and signals during insertion.

16

12

17 **4.10.1** Power Classes and Maximum Power Consumption

SFP-DD/SFP-DD112 power classes are defined in Table 11. Since different classes of modules exist with pre-defined maximum power consumption limits, it is necessary to avoid exceeding the system power supply limits and cooling capacity when a module is inserted into a system designed to only accommodate lower power modules. It is recommended that the host identify the power class of the module before allowing the module to go into high power mode.

Power levels associated with classifications of modules are shown in Table 11.

23 24

- 25
- 26

Table 11- Power Classification				
Power Class	Max Power (W)			
1	1.0			
2	1.5			
3	2.0			
4	3.5			
5	5.0			
6	reserved			
7	reserved			
8	See management register for maximum power			
consumption.				

27

In general, the higher power classification levels are associated with higher data rates and longer reaches.
 The system designer is responsible for ensuring that the maximum case temperature does not exceed the case temperature requirements.

31

1 4.10.2 Host Board Power Supply Filtering

- The host board should use the power supply filtering equivalent to that shown in Figure 10.
- 2 3

4 5

6 7

12

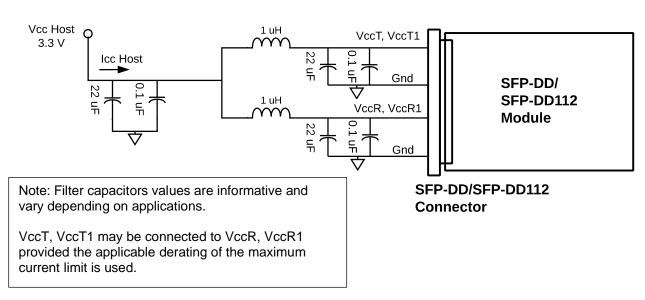

Figure 10: Recommended Host Board Power Supply Filtering

Any voltage drop across a filter network on the host is counted against the host DC set point accuracy
 specification. Inductors with DC Resistance of less than 0.1 Ohm should be used in order to maintain the
 required voltage at the Host Card Edge Connector. It is recommended that the 22 μF capacitors each have an
 equivalent series resistance of 0.22 ohms.

The specifications for the power supply are shown in Table 12. The limits in Table 12 apply to the combined current that flows through all inductors in the power supply filter (represents ICC host Figure 10). An example test method for measuring inrush current can is Keysight Technologies application brief 5991-2778EN.pdf.

17 **4.10.3 Module Power Supply Specification**

18 In order to avoid exceeding the host system power capacity, upon hot-plug, power cycle or reset, all SFP-

19 DD/SFP-DD112 modules shall power up in Low Power Mode if LPMode is asserted. If LPMode is not

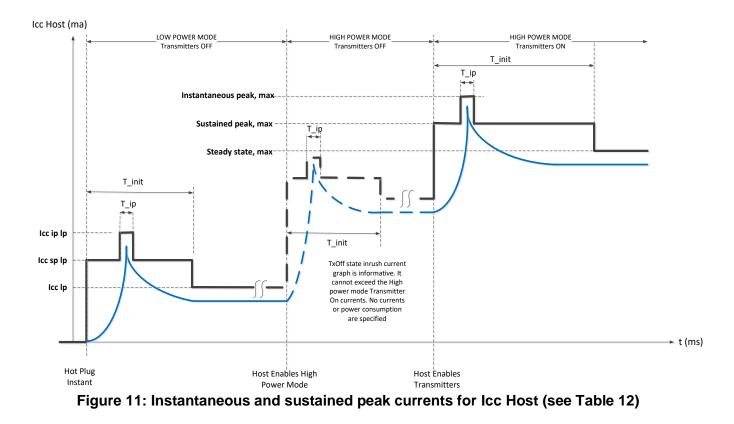

asserted the module will proceed to High Power Mode without host intervention. Figure 11 shows waveforms

- for maximum instantaneous, sustained and steady state currents for Low Power and High Power modes.
- Specification values for maximum instantaneous, sustained and steady state currents at each power class are given in Table 12.
- 24

Table 12- Power Supply specifications, Instantaneous, sustained and steady state current limits

 2. Host designers are responsible for handling 1.5W Low Power mode SFP classic modules as appropriate in their system.
 3. User must read management register for maximum power consumption.
 4. The module must stay within its declared power class. (1

4 4.10.4 Host Board Power Supply Noise Output

The host noise output on VccT/VccT1, and VccR/VccR1 supplies are defined with resistive loads that draws
the maximum rated power supported by the host power class, see Figure 12. The resistive loads are
connected in place of the module between VccT/VccT1 and VccR/VccR1 and the Vee. When the noise is
measured on VccT/VccT1, VccR/VccR1 is left open circuit, and vice versa. Host power supply limits are given
in Table 11. The noise power spectrum is measured for each of the 2 rails then integrated from 40 Hz to 10
MHz and converted to a voltage, eN Host, with limit specified in Table 13.

1 4.10.5 Module Power Supply Noise Output

The SFP-DD/SFP-DD112 modules, when plugged into a reference module compliance board shall generate noise less than the value in Table 13. The module must pass module power supply noise output test in all operating modes. This test ensures the module will not couple excessive noise from in- side the module back onto the host board. A power meter technique, or a spectrum analyzer technique with integration of the spectrum, may be used.

7

8 The RMS module noise voltage output is defined in the frequency band from 40 Hz to 10 MHz. Module noise 9 output shall be measured with an appropriate probing technique at point X, Figure 13 and must meet limits 10 given in Table 13. The module must pass module power supply noise output test in all operating modes. This

11 test ensures the module will not couple excessive noise from inside the module back onto the host board.

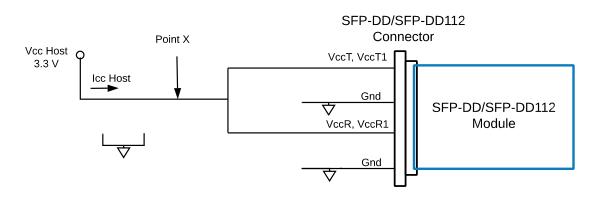

Figure 13: Module Noise Output Measurement

12 13 14

15 4.10.6 Module Power Supply Noise Tolerance

16 The SFP-DD/SFP-DD112 modules shall meet all requirements and operate within the design specifications in the presence of a reference noise waveform described in Table 13 superimposed on the DC voltage. The 17 reference noise waveform consists of a sinusoidal 40 Hz to 10 MHz noise generated by Osc1 and added to 18 19 Vcc PSU, see Figure 14. This emulates the worst-case noise that the module must tolerate and operate 20 within the design specifications. The reference noise is generated by Osc1 and amplified by the Power OpAmp then added to Vcc PSU through a Bias-T, see Figure 11. Example of suitable Power OpAmp are 21 Analog Devices ADA4870 and TI THS3491. With power supply filter components removed, point X measures 22 23 the noise voltage applied to the module. To facilitate power supply tolerance testing at frequencies $< \sim 100$ kHz due to Power OpAmp interaction with PSU and low frequency response of the Bias-T, it is recommended 24 25 to use noise source Osc2 modulating PSU sense line to generate sinusoidal noise directly on the PSU output, 26 see Figure 15. Osc2 amplitude level is adjusted while observing point X amplitude level as defined in Table 13 27 for module in low power and high-power modes. To modulate the PSU sense lines, the PSU must have high 28 speed sense tracking. An example of PSU with high-speed sense tracking are TI TPSM5D1806 and Keysight N6700 with N6781/N6782 plugins. 29

30

For modules without or limited input stage power filtering one may measure the applied noise to the module by 31 32 measuring point X directly while the module is active and either in low or high-power modes. But to take credit 33 for any input stage power filtering in the module, the DUT module is replaced with a resistive load drawing equivalent current of a module configured in low power mode, the DUT module is then replaced with a 34 35 resistive load drawing equivalent current of a module configured in high power mode. Osc1 and Osc2 are 36 adjusted to produce maximum PSNR level as defined in Table 13 at point X with resistive loads drawing the same power as the module in low and high-power modes. The resistive loads are then replaced with the DUT 37 38 module with the same Osc1/Osc2 amplitude settings that produced the max PSNR with the resistive loads.

1

4 5 6

Table 13- Power Supply Output Noise and Tolerance Specifications

Notes: An appropriate probing technique is required for noise measurement at point X. For modules with

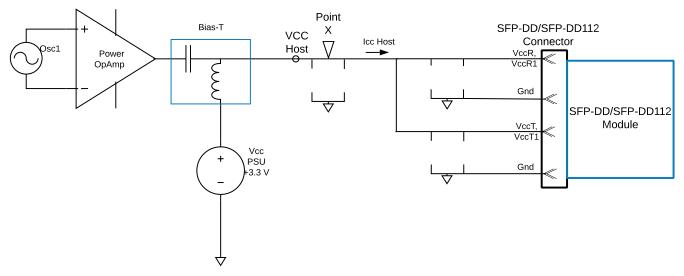

limited or no decoupling directly connected to host PSU, the PSNR can be directly measured at point X with

module plugged into the host for module operating in low power and high power modes. Osc1 or Osc2 are adjusted to provide maximum PSNR at point X for a given module in low power and full power modes.

	Parameter	Symbol	Min	Nom	Max	Unit	
Ho	ost RMS noise output 40 Hz-10 MHz (eN_Host) ^{1,3}				25	mV

	1, 2, 3, 4, 5, 6, 7, 8, 9, 10 MHz.						

2 3

4

5 6

8 **4.11 ESD**

Where ESD performance is not otherwise specified, e.g. in the InfiniBand specification, the SFP-DD/SFPDD112 module shall meet ESD requirements given in EN61000-4-2 [7], criterion B test specification when
installed in a properly grounded cage and chassis. The units are subjected to 15 kV air discharges during
operation and 8 kV direct contact discharges to the case. All the SFP-DD/SFP-DD112 module and host pins
including high speed signal pins shall withstand 1000 V electrostatic discharge based on Human Body Model
per ANSI/ESDA/JEDEC JS-001 [8].

Figure 15: Module Low Frequency Noise Tolerance

2 5. Optical Port Mapping and Optical Interfaces

3

Electrical data input/output to optical port mapping 4 5.1

Table 14 defines the mapping of electrical TX data inputs to optical ports. The mapping of the RX optical ports 5 6 to electrical RX outputs is symmetric. Note that there is no defined mapping of electrical input/output to optical 7 wavelengths for WDM applications.

8 9

Table 14- Electrical data input to Optical Port Mapping

11 5.3 Module Color Coding and Labeling

12 If provided, color coding shall be on an exposed feature of the SFP-DD/SFP-DD112 module (a feature or surface extending outside of the bezel). Color code are outside the scope of this specification. 13

15 Each SFP-DD/SFP-DD112 module shall be clearly labeled. The complete labeling need not be visible when the SFP-DD/SFP-DD112 module is installed, and the bottom of the device is the recommended location for the 16 17 label. Labeling shall include:

- Appropriate manufacturing and part number identification
- Appropriate regulatory compliance labeling
- A manufacturing traceability code. •

The label should also include clear specification of the external port characteristics such as:

- Optical wavelength •
- Required fiber characteristics •
- Operating data rate •
- Interface standards supported •
- Link length supported. •

The labeling shall not interfere with the mechanical, thermal or EMI features.

1 6. SFP-DD Mechanical and Board Definition

2 6.1 Introduction to SFP-DD and SFP-DD112

The cages and modules specifications defined in this chapter are illustrated in Figure 23 (press fit cage) and
 Figure 24 (pluggable module). All Pluggable modules and direct attach cable plugs must mate to the

5 connectors and cages defined in this specification. (See SFF-8432 [26]) Heat sink/clip thermal designs are

- 6 application specific and not specifically defined by this specification. The SFP-DD and SFP-DD112 modules
- 7 and cage support both a pull tab and a bail latch solution. Details on bail latch retention and extraction
- 8 specifications can be found in SFF-8432.
- 9 10

6.2 SFP-DD/SFP-DD112 Datums, Dimensions and Component Alignment

A listing of the SFP-DD/SFP-DD112 datums for the various components are contained in Table 15. To reduce the complexity of the drawings, all dimensions are considered centered unless otherwise specified. Dimensions and tolerancing conform to ASME Y14.5-2009 [4]. All dimensions are in millimeters.

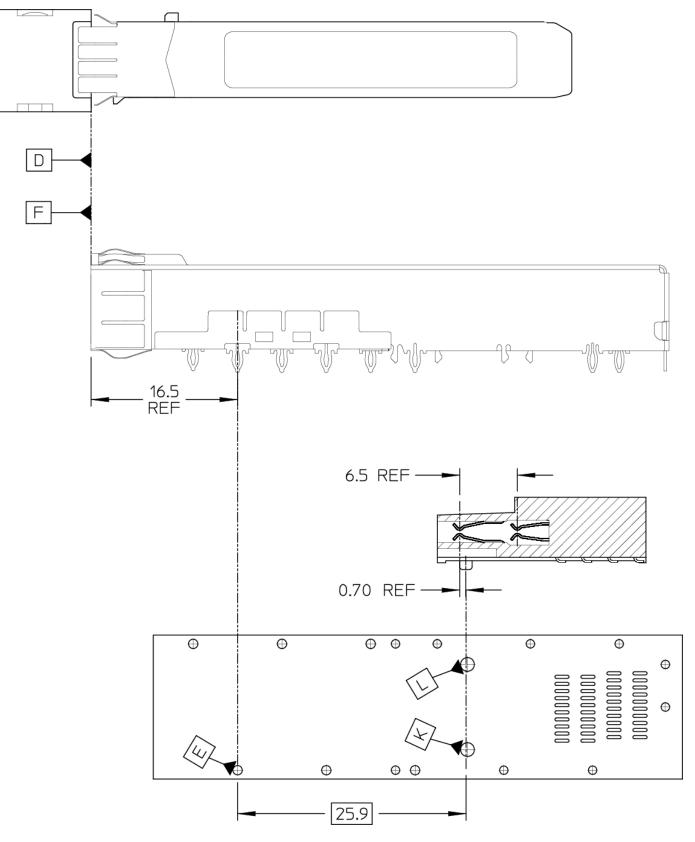

Table 15- Datum Description

Datum	Description	
А	Width Of module	
В	Bottom surface of module	
С	Leading edge of signal contact pads on module paddle card	
D	Hard stop on module	
Е	Host board thru hole to accept primary cage press fit pin	
F	Hard stop on cage	
G	Bottom surface of bezel cutout	
K	Host board thru hole #1 to accept connector guidepost	
L	Host board thru hole #2 to accept connector guidepost	
Р	Vertical center line of internal surface of cage	
S	Seating plane of cage on host board	
Z	Top surface of host board	
AA	Center line of module paddle card width	
BB	Top surface of module paddle card	
CC	Center line of connector slot width	
DD	Seating plane of connector on host board	

1 6.3 SFP-DD Cage, Connector, Module Alignment

2 The alignment of the cage, connector and module are shown in Figure 25.

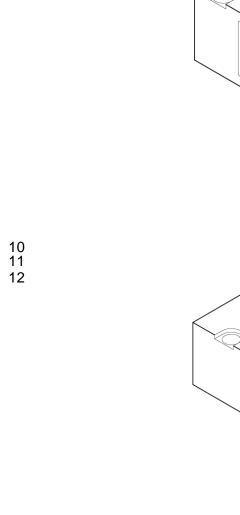

1 6.4 SFP-DD/SFP-DD112 Module Mechanical Dimensions

The mechanical outline for the SFP-DD/SFP-DD112 modules and direct attach cables are shown in Figure 26. The module shall provide a means to self-lock with the cage upon insertion. The module package dimensions are defined in Figure 27. The dimensions that control the size of the module that extends outside of the cage are listed as maximum dimensions per Note 4 in Figure 27.

Type 1 module

 Type 2 module

Figure 26: Type 1 and Type 2 Modules

Published Specification

NOTES APPLY TO MODULE DRAWINGS :
1. DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5-2009
2. SHARP CORNERS AND EDGES ARE NOT ALLOWED. ROUND OFF ALL EDGES AND CORNERS.
3 RECOMMENDED MAXIMUM. MODULE LENGTH EXTENDING OUTSIDE OF CAGE. OTHER LENGTHS ARE APPLICATION SPECIFIC.
A INDICATED OUTLINE DEFINES MAXIMUM ENVELOP OUTSIDE THE CAGE. THE SURFACES OF THE MAXIMUM ENVELOP MAY BE CONTACTED BY AN ADJACENT MODULE EMI SPRINGS DURING INSERTION AND EXTRACTION OF THE MODULE FROM THE CAGE. THE SURFACES SHALL NOT HAVE ANY SHAPES OR MATERIALS THAT CAN DAMAGE THE ADJACENT MODULE EMI SPRINGS OR BE DAMAGED THEMSELVES BY THE SPRINGS.
5 DIMENSIONS DEFINES EMI SPRING CONTACT POINT WITH MODULE CAGE.
6 LEAD-IN CHAMFER DIMENSION MEASURED FROM TSC (THEORETICAL SHARP CORNER).
A BLOCKING RIB FEATURE TO PREVENT SFP-DD MODULE FROM MATING INTO LEGACY SFP CONNECTOR.
8 FLATNESS SPECIFICATION APPLIES OVER THE ENTIRE HEAT SINK AREA. REFER TO SECTION 5.4 TABLE 9FOR FLATNESS REQUIREMENTS.
PRODUCT LABEL ON BOTTOM AND/OR SIDES TO BE FLUSHED OR RECESSED BELOW EXTERNAL SURFACES. LABEL(S) SHALL NOT INTERFERE WITH THE MECHANICAL, THERMAL, OR EMC PROPERTIES.

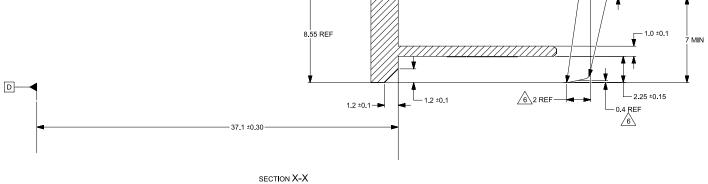

Figure 27: Detailed dimensions of module

6.5 SFP-DD/SFP-DD112 Module Flatness and Roughness

Module flatness and roughness are specified to improve module thermal characteristics when used with a riding heat sink. Relaxed specifications are used for lower power modules to reduce cost. The module flatness and roughness specifications apply to the specified heat sink contact area as specified in Figure 27. Specifications for Module flatness and surface roughness are shown in Table 16.

10 6.6 SFP-DD Module paddle card dimensions

- NOTES APPLY TO MODULE PADDLE CARD :
- 1. DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5-2009
- 2. ALL DIMENSIONS ARE IN MILLIMETERS
- 3. NO SOLDER MASK WITHIN 0.05 MM OF ALL DEFINED CONTACT PAD EDGES
- 4. NO SOLDER MASK BETWEEN END CONTACTS AND THE SIDES OF THE PADDLE CARD
- DATUM C IS ESTABLISHED WITH DATUM TARGET POINTS AT THE LEADING EDGE OF THE OUTER MOST SIGNAL CONTACTS PADS TO BE RE-ESTABLISHED ON EACH SIDE
- DIMENSION APPLIES FROM THE FIRST SET OF SIGNAL PADS TO THE SECOND SET OF SIGNAL PADS
- DIMENSION AND TOLERANCE APPLIES TO ALL PADS ON BOTH TOP AND BOTTOM SIDE OF THE PADDLE CARD
- A ZERO GAP IS ALLOWED FOR A CONTINUOUS PAD OPTION
- APPLIES TO ALL SIGNAL PAD TO PRE-WIPE PAD SPACING
- 10 PRE-WIPE PADS (SHADED AREA) ON MODULE CARD HOST SIDE ARE OPTIONAL
- PRE-WIPE PADS (UNSHADED AREA) ARE REQUIRED EXCEPT IN CONTINUOUS POWER AND GROUND PAD DESIGNS
- $\stackrel{\frown}{12}$ paddle card thickness is measured over pads vias must not be proud of the pad surface
- MINIMUM DIMENSION REQUIRED FOR MATING SEQUENCE BETWEEN SIGNAL AND GROUND PADS
- 15 COMPONENT KEEP OUT AREA MEASURED FROM DATUM C
- \bigtriangleup A SINGLE SPLIT IN THE PRE-WIPE SIGNAL PAD IS OPTIONAL, AND IF IMPLEMENTED, THE RESULTING 2 PADS SHALL BE SEPARATED WITH A GAP OF 0.13 \star 0.05
- 17. PRE-WIPE PADS ENSURE ADEQUATE WIPE REQUIRED TO PROVIDE A RELIABLE ELECTRICAL INTERCONNECT WHILE MINIMIZING SIGNAL INTEGRITY STUB EFFECTS
- CONTACT PAD PLATING

 0.38 MICROMETERS MINIMUM GOLD OVER
 1.27 MICROMETERS MINIMUM NICKEL
 ALTERNATE CONTACT PAD PLATING
 - 0.05 MICROMETERS MINIMUM GOLD OVER
 - 0.30 MICROMETERS MINIMUM PALLADIUM OVER 1,27 MICROMETERS MINIMUM NICKEL
- 12 13

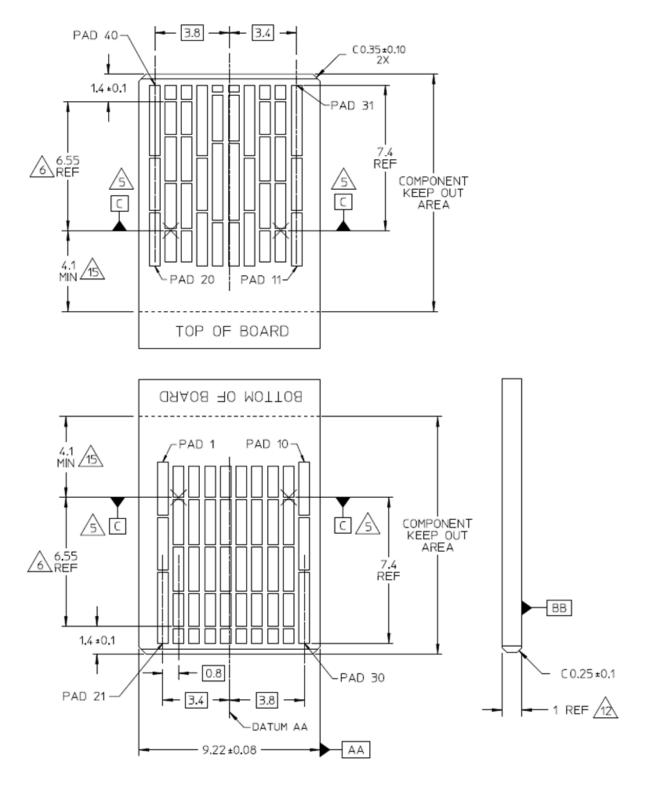

Figure 28: Module paddle card dimensions

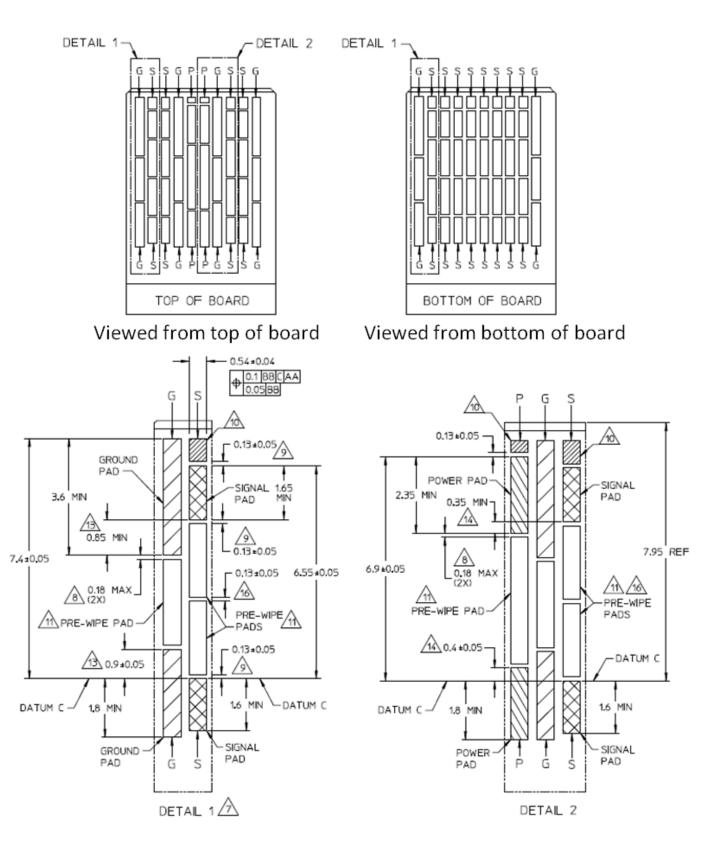

Figure 29: Module pad dimensions

1 6.7 SFP-DD/SFP-DD112 Module Extraction and Retention Forces

The requirements for insertion forces, extraction forces and retention forces are specified Appendix A. The SFP-DD/SFP-DD112 cage and modules are designed to ensure that excessive force applied to a cable does not damage the SFP-DD cage or host connector. If any part is damaged by excessive force, it should be the cable or media module and not the cage or host connector which is part of the host system. Examples of module retention mechanisms are found in SFF-8432 [26] Figures 4-4 through 4-7. The contact pad plating shall meet the requirements are given in 6.6.

8

9 6.8 Press fit Cage Mechanical

The SFP-DD Cage is shown in Figure 30 with detailed drawings in Figure 31. Recommendations for the cage
 bezel opening are shown in Figure 33.

12

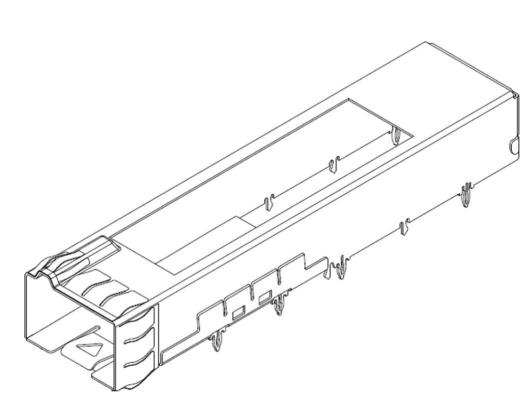

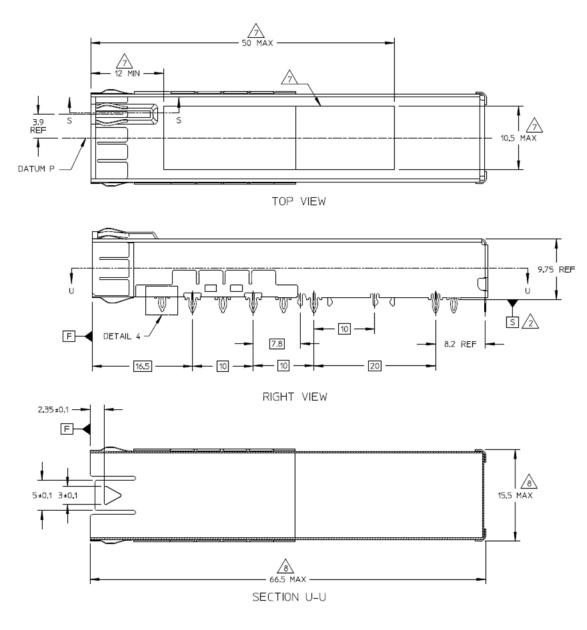

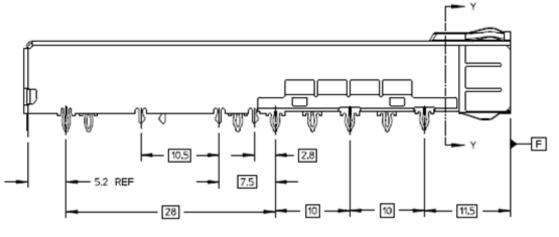

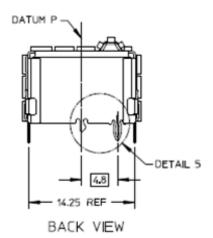

Figure 30: Press Fit 1x1 Cage

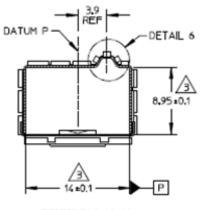

NOTES APPLY TO 1 X N CAGE DRAWINGS :
1. DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5-2009
2 datum s is defined by the seating surface on the host board
3 DIMENSIONS FROM INSIDE SURFACES OF CAGE
SIZE AND SHAPE OF CAGE PINS SHALL BE DEFINED BY EACH SUPPLIER BASED UPON THE PCB FOOTPRINT LAYOUT
APPLIES TO 1.05 MM PCB HOLE DIAMETER
6 APPLIES TO 0.95 MM PCB HOLE DIAMETER
CUTOUT OPENING FOR HEAT SINK IS OPTIONAL
8 MAXIMUM ENVELOPE DIMENSION INCLUDES BACK COVER FOLDING TABS AND BOTTOM COVER ATTACHMENT FEATURES
APPLIES TO ALL RADAII SURFACES BETWEEN POINTS A AND B
$\cancel{10}$ APPLIES TO ALL FLAT SURFACES BETWEEN POINTS A AND B

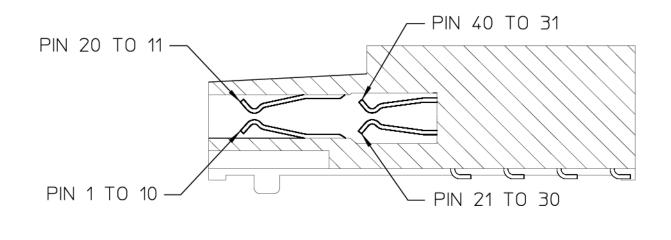

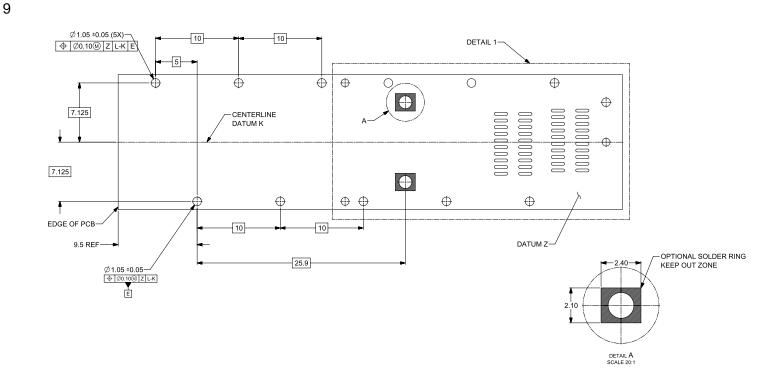

Figure 35: 1x1 Connector Design and Host PCB Pin Numbers

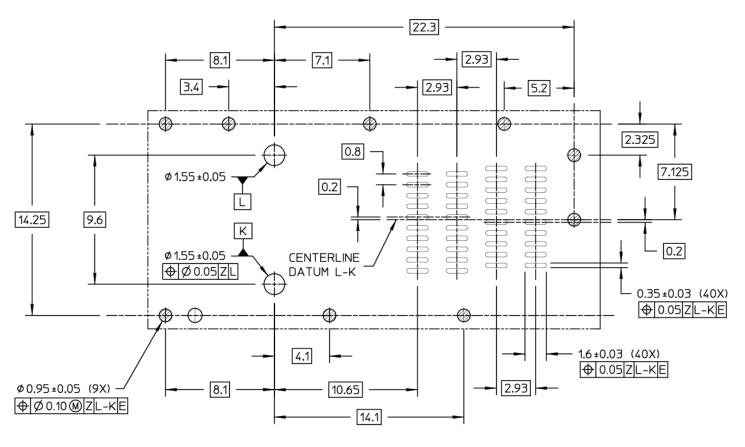

6.9.1 SMT connector and cage host PCB layout

A typical host board mechanical layout for attaching the SFP-DD SMT Connector and press fit Cage System is shown in Figure 36. Location of the pattern on the host board is application specific.

To achieve 25-50 Gbps performance pad dimensions and associated tolerances must be adhered, and attention paid to the host board layout.

10

DETAIL 1

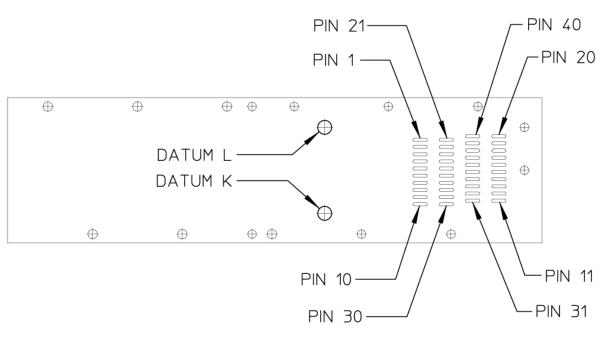

Figure 36: Host PCB Mechanical Layout

7. SFP-DD112 Mechanical and Board Definition 1

2 SFP-DD112 module mechanical specifications are compatible with SFP-DD module mechanical specifications 3 in chapter 6, below are the list of relevant SFP-DD sections applicable to SFP-DD112:

- 4 6.1 Introduction to SFP-DD and SFP-DD112 5
 - 6.2 SFP-DD/SFP-DD112 Datums, Dimensions and Component Alignment
- 6 6.4 SFP-DD/SFP-DD112 Module Mechanical Dimensions
- 7 6.5 SFP-DD/SFP-DD112 Module Flatness and Roughness
- 8 6.7 SFP-DD/SFP-DD112 Module Extraction and Retention Forces. 9

Introduction 10 7.1

11 The module paddle card dimensions of the SFP-DD112 have been improved to support 100 Gb/s PAM4 (up to 12 56 GBd) serial data rates, see Section 4.

13

SFP-DD112 supports multiple connector/cage form factors. SFP-DD112 cages/connectors/modules are 14 15 compatible with SFP-DD cages/connectors/modules, SFP-DD112 cages/connectors also accepts SFP+/SFP2 [26]/[28] family of modules. Examples of SFP-DD112 cages are: 16

17 1x1 surface mount connector/cage. • 18

19 7.2 SFP-DD112 module mechanical dimensions

20 The mechanical outline for the SFP-DD112 module and direct attach cables are identical to Figure 22. The 21 module shall provide a means to self-lock within the cage upon insertion. The module package dimensions are identical to Figure 23 with exception of bottom view shown in Figure 37. For SFP-DD112 modules the bottom 22 surface of the module within the cage shall be flat without a pocket. The options for the position of the label 23 24 could include the bottom surface of the module that protrudes outside the bezel of the cage or etched into the 25 metal surface.

26

Caution should be exercised that any etchings do not affect thermal performance. Flatness and roughness 27 specs are defined in 6.5 apply to both top and bottom surfaces of SFP-DD112 module. 28

29

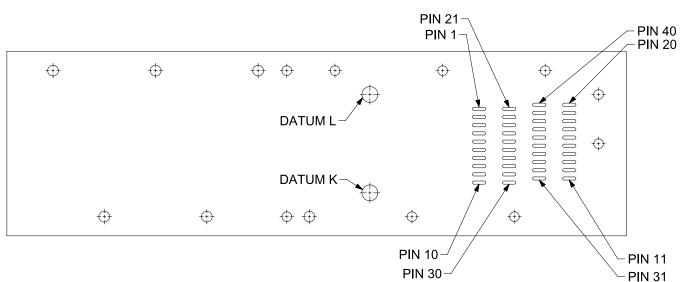

Figure 43: Host PCB Mechanical Layout

2 8. Environmental and Thermal

3

4 8.1 Thermal Requirements

5 The SFP-DD/SFP-DD112 module shall operate within one or more of the case temperatures ranges defined in 6 Table 17. The temperature ranges are applicable between 60 m below sea level and 1800 m above sea level, 7 NEBS GR-63 [16], utilizing the host systems designed airflow.

8

9

Table 17- Temperature Range Class of operation

Class	Case Temperature Range
Standard	0°C through 70°C
Extended	-5°C through 85°C
Industrial	-40°C through 85°C

10

11 SFP-DD/SFP-DD112 are designed to allow for up to 48 modules; stacked, ganged and/or belly-to-belly in a 1U 12 19" rack, with the appropriate thermal design for cooling/airflow.

13

17

Appendix A Normative Module and Connector Performance Requirements 1

2 A.1 **Performance Tables**

3 EIA-364-1000 [6] shall be used to define the test sequences and procedures for evaluating the connector system described in this document. Where multiple test options are available, the manufacturer shall select 4 5 the appropriate option where not previously specified. The selected procedure should be noted when reporting data. If there are conflicting requirements or test procedures between EIA-364 procedures and those 6 7 contained within this document, this document shall be considered the prevailing authority. Unless otherwise 8 specified, procedures for sample size, data, and collection to be followed as specified in EIA-364-1000. See 9 EIA-364-1000 Annex B for objectives of tests and test groups.

10

This document represents the minimum requirements for the defined product. Additional test conditions and 11 evaluations may be conducted within the defined EIA-364-1000 sequences. More extreme test conditions and 12 failure criteria may be imposed and still meet the requirements of this document. 13 14

- 15 Table 18 summarizes the performance criteria that are to be satisfied by the connector described in this document. Most performance criteria are validated by EIA-364-1000 testing, but this test suite leaves some 16 test details to be determined. To ensure that testing is repeatable, these details are identified in Table 19. 17 18 Finally, testing procedures used to validate any performance criteria not included in EIA-364-1000 are 19 provided in Table 20.
- 20 21

Table 18- Form Factor Performance Re	equirements
Description/Dotails	Poquiromonte

Performance	Description/ Details	Requirements	
Parameters			
Mechanical/ Physi	ical Tests		
Plating Type	Plating type on connector contacts	Precious (refer to 6.6 for plating details)	
Surface Treatment	Surface treatment on connector contacts; if surface treatment is applied, Test Group 6 is required	Manufacturer to specify	
Wipe length	Designed distance a contact traverses over a mating contact surface during mating and resting at a final position. If less than 0.127 mm, test group 6 is required	Manufacturer to specify	
Rated Durability	The expected number of durability cycles a	Connector/ cage: 100 cycles	
Cycles	component is expected to encounter over the course of its life	Module: 50 cycles	
Mating Force ¹	Amount of force needed to mate a module with a connector when latches are deactivated	SFP+/SFP2 module: 40 N MAX SFP-DD/SFP-DD112 module: 40 N MAX	
Unmating Force ¹	Amount of forced needed to separate a module from a connector when latches are deactivated	SFP+/SFP2 module: 12.5 N MAX SFP-DD/SFP-DD112 module: 30 N MAX	
Latch Retention ¹	Amount of force the latching mechanism can withstand without unmating	SFP+/SFP2 module: 90 N MIN SFP-DD/ SFP-DD112 module: 90 N MIN	
Cage Latch Strength ¹	The amount of force that the cage latches can hold without being damaged.	100 N MIN	
Cage Retention to Host Board ¹	Amount of force a cage can withstand without separating from the host board	SFP+/SFP2 module: 100 N MIN SFP-DD/ SFP-DD112 module: 100 N MIN	
Environmental Re	quirements		
Field Life	The expected service life for a component	10 years	
Field Temperature	The expected service temperature for a component	65°C	
Electrical Requirements			
Current	Maximum current to which a contact is exposed in use	0.5 A per signal contact MAX 1.5 A per power contact MAX	
Operating Rating Voltage	Maximum voltage to which a contact is exposed in use	30 V DC per contact MAX	
Note: 1. These perform	ance criteria are not validated by EIA-364-1000 testing	, see Table 20 for test procedures and	

pass/fail criteria.

Table 19 describes the details necessary to perform the tests described in the EIA-364-1000 test sequences. Testing shall be done in accordance with EIA-364-1000 and the test procedures it identifies in such a way that the parameters/ requirements defined in Table 18 are met. Any information in this table supersedes EIA-364-1000.
